

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The network traffic logs show that DNS requests to access yummyrecipesforme.com were sent to the DNS server at 203.0.113.2. The ICMP responses returned “UDP port 53 unreachable,” indicating that the DNS service could not be reached. This prevents the domain name from being resolved and may explain why users cannot access the website.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

The incident occurred at approximately 1:24 PM, 1:26 PM, and 1:28 PM, when repeated DNS requests received the same error. The IT team became aware of the issue after users reported that they could not access the website. The IT team reproduced the problem and used tcpdump to analyze the network traffic. The investigation showed that DNS requests were being sent to UDP port 53, but the port was unreachable. A likely cause is that the DNS server or DNS service is down or unavailable, preventing the domain from being resolved.
